

Number System

Method to represent numeric values or quantities using different digits.

Symbols \rightarrow differently arranged \Rightarrow quantity
eg. 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 \Rightarrow 17, 100, 91 etc.

① Decimal Number System \rightarrow

\rightarrow It has base 10. \rightarrow (0-9 digits)

\hookrightarrow Base is the number of symbols (digits) a number system uses.

\rightarrow It uses digits from 0 to 9.

② Binary Number System \rightarrow

\rightarrow It has base 2. \rightarrow (0 and 1 digits)

\rightarrow Only two symbols are used i.e. 0 and 1.
(or digits)

Anything inside memory is stored in binary and CPU also does calculation in binary.

eg \rightarrow 5 (In decimal) \longrightarrow 101 (In binary)

③ Decimal to Binary Conversion -

1. Division Method -

1. Divide Number by 2.

2. Store remainder. (That will be a bit in binary).

3. Repeat above steps with the quotient until quotient is less than 2.

4. Reverse the bits.

eg \rightarrow N = 10

we got

\hookrightarrow 0101

now reverse the bits

\Rightarrow 1010, which is 10 in binary no. system.

Division	Rem
10/2 = 5	0
5/2 = 2	1
2/2 = 1	0
1/2 = 0	1

~~int~~ ~~demo~~

```
int decimalToBinary (int n) {  
    int binaryNo = 0; i = 0;  
    while (n > 0) {  
        int i = 0;  
        int bit = n % 2;  
        n /= 2;  
        binaryNo += bit * pow(10, i++);  
        n /= 2;  
    }  
    return binaryNo;  
}
```

$$\begin{array}{l} 10 \quad 10 \\ \swarrow \quad \searrow \\ 0 \times 10^0 + 0 = 0 \\ 1 \times 10^1 + 0 = 10 \\ 0 \times 10^2 + 10 = 10 \\ 1 \times 10^3 + 10 = \underline{\underline{1010}} \end{array}$$

```
int main() {  
    int n;  
    cin >> n;  
    int binary = decimalToBinary(n);  
    cout << binary << endl;  
    return 0;  
}
```

• dry run →

$n = 10$
 $i = 0$
 $n > 0 \rightarrow 10 > 0 \rightarrow T$
 ~~$i = 0$~~

~~1010~~
01010
binaryNo

i 0 ~~1~~ 3

$$\text{bit} = 10 \% 2 = 0$$

$$\begin{aligned} \text{binaryNo} &= 0 + \text{bit} \times \text{pow}(10, 0) \\ &= 0 + 0 \times 10^0 = \underline{\underline{0}} \end{aligned}$$

(i is incremented by 1)

$$n = 5$$

$$5 > 0 \rightarrow T$$

$$\text{bit} = 5 \% 2 = 1$$

$$\begin{aligned} \text{binaryNo} &= 0 + 1 \times 10^1 \\ &= \underline{\underline{10}} \end{aligned}$$

$$i = 1 + 1 = 2$$

$$n = 2$$

$$2 > 0 \rightarrow T, \quad \text{bit} = 2 \% 2 = 0, \quad \text{binaryNo} = 10 + 0 \times 10^2 = \underline{\underline{10}}$$

$$i = 2 + 1 = 3$$

$$n = 2 / 2 = 1$$

$$1 > 0 \rightarrow T, \quad \text{bit} = 1 \% 2 = 1, \quad \text{binaryNo} = 10 + 1 \times 10^3 = \underline{\underline{1010}}$$

$$i = 3 + 1 = 4$$

$n = 1/2 = 0$
 $0 > 0 \rightarrow \text{False (out of loop)} \Rightarrow \text{return binaryNo.} \underline{\underline{1010}}$

2. Bitwise Method -

~~1. Obtain bit with bitwise AND operation i.e. (n & 1)~~

1. Obtain bit with bitwise AND operation i.e. (n & 1)

2. Right Shift n by 1. ($n = n >> 1$)

3. Repeat above steps till $n > 0$.

4. Reverse the bits.

eg → $n = 10$

0, 1, 0, 1

$$\begin{array}{r} 10 \\ \& 1 \\ \hline 0 \end{array} = 0, \quad 10 >> 1 = 5 = 101$$

$$101 \& 1 = 1, \quad 5 >> 1 = 2 = 10$$

$$10 \& 1 = 0, \quad 10 >> 1 = 5$$

$$1 \& 1 = 1$$

10 ⇒ 1010 (in binary)

code -

```
int bitwiseMethod (int n) {
```

```
    int binaryNo = 0;
```

```
    int i = 0;
```

```
    while (n > 0) {
```

```
        int bit = (n & 1);
```

```
        binaryNo += bit * pow(10, i);
```

```
        n = n >> 1;
```

```
    }
```

```
    return binaryNo;
```

```
}
```

① Binary to Decimal Conversion →

1. Multiply each digit with its place value.

2. Add up all place values.

3. Sum is the decimal number.

$$\begin{array}{ccc} 1 & 2 & 3 \\ \downarrow & \downarrow & \downarrow \\ 1 \times 10^0 & 2 \times 10^1 & 3 \times 10^2 \\ \downarrow & & \\ 100 & + & 20 + 3 = 123 \end{array}$$

$$\text{place value} = \text{digit} \times (\text{base})^i$$

$$\begin{array}{cccc}
 1 & 0 & 1 & 0 \\
 \downarrow & \downarrow & \downarrow & \downarrow \\
 1 \times 2^3 & 0 \times 2^2 & 1 \times 2^1 & 0 \times 2^0 \\
 8 & 0 & 2 & 0 \\
 \hline
 8 + 0 + 2 + 0 = 10
 \end{array}$$

$$\begin{array}{r}
 111 \\
 10 \overline{) 111} \\
 \underline{10} \\
 11 \\
 \underline{10} \\
 1
 \end{array}$$

$$111 \% 10 = 1$$

code →

```

int binaryToDecimal (int n) {
    int decimal = 0;
    int i = 0;
    while (n > 0) {
        int bit = n % 10;
        decimal = decimal + bit * pow(2, i++);
        n /= 10;
    }
    return decimal;
}

```

dry run -

binary → (1010)₂

$$\text{bit} = 1010 \% 10 = 0$$

$$\text{decimal} = 0 + 0 \times 2^0 = 0$$

$$n = n / 10 = 101$$

$$\text{bit} = 101 \% 10 = 1$$

$$\text{decimal} = 0 + 1 \times 2^1 = 2$$

$$n = n / 10 = 10$$

$$\text{bit} = 10 \% 10 = 0$$

$$\text{decimal} = 2 + 0 \times 2^2 = 2$$

$$n = n / 10 = 1$$

$$\text{bit} = 1 \% 10 = 1$$

$$\text{decimal} = 2 + 1 \times 2^3 = 2 + 8 = 10$$

$$n = 1 / 10 = 0$$
